Declaration of interest

- Research contracts (BMS/PFIZER)
- Others (Honorarium as a speaker for Bayer, Astra-Zeneca and BMS)

Management of antithrombotics in patients with TAVI

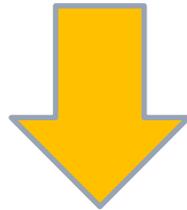

Bioprosthesis	Class	Level
Anticoagulation		
DAPT should be considered for the first 3–6 months after TAVI, followed by lifelong SAPT in patients who do not need OAC for other reasons.	IIa	C

Management of antithrombotics in patients with TAVI

Bioprosthesis	Class	Level
Anticoagulation		
SAPT may be considered after TAVI in the case of high bleeding risk.	IIb	C
OAC may be considered for the first 3 months after surgical implantation of an aortic bioprosthesis.	IIb	C

DETERMINANTS OF ANTITHROMBOTIC Tx?

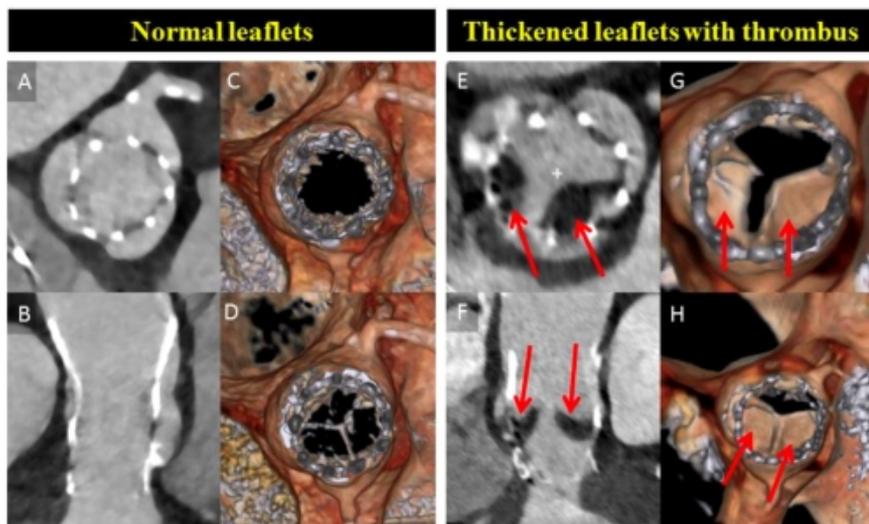

- 1/3 → SCAD or stent PCI
- 1/3 → Secondary prevention for stroke
- 2/5 → Permanent AF or NOAF

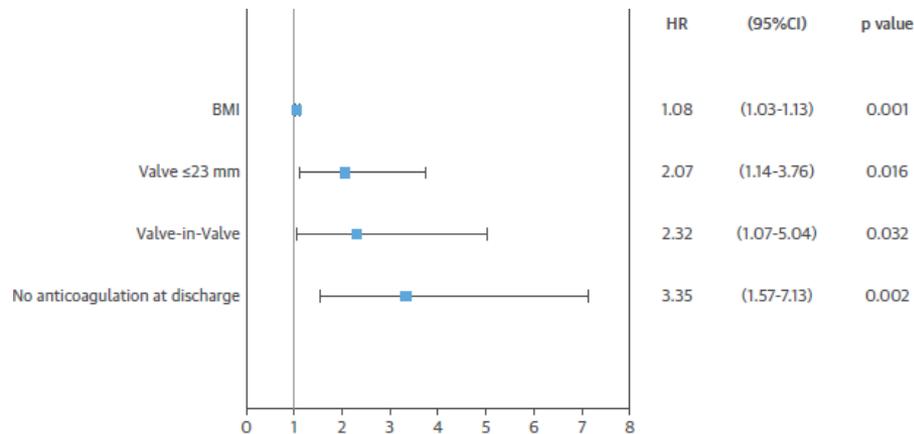

- 30% → Antiplatelet Therapy alone
- 50% → Oral Anticoagulation alone
- 25% → OAC + APT

BIOPROSTHETIC VALVE DYSFUNCTION

- \nearrow in mean gradient (MG) ≥ 10 mmHg or new MG ≥ 20 mmHg
- Prevalence of 4.5% post-TAVR

Makkar et al, NEJM, 2015

Del trigo et al, JACC, 2016

OBJECTIVES

- To investigate whether **anti-thrombotic treatment** influences **long-term mortality and early bioprosthetic valve dysfunction*** (↗ prosthetic gradient ≥ 10 mmHg or new gradient ≥ 20 mmHg)
- To explore **independent correlates** of long-term mortality and early BVD after TAVI.

STUDY OVERSIGHT

- **Nation-wide France-Tavi Registry***
- **Sponsors** → Société Française de Cardiologie
- **Fundings** → Edwards Life Science, Medtronic, Action-Coeur
- **Statistical Analysis** → StatEthic and Action-Coeur

METHODS

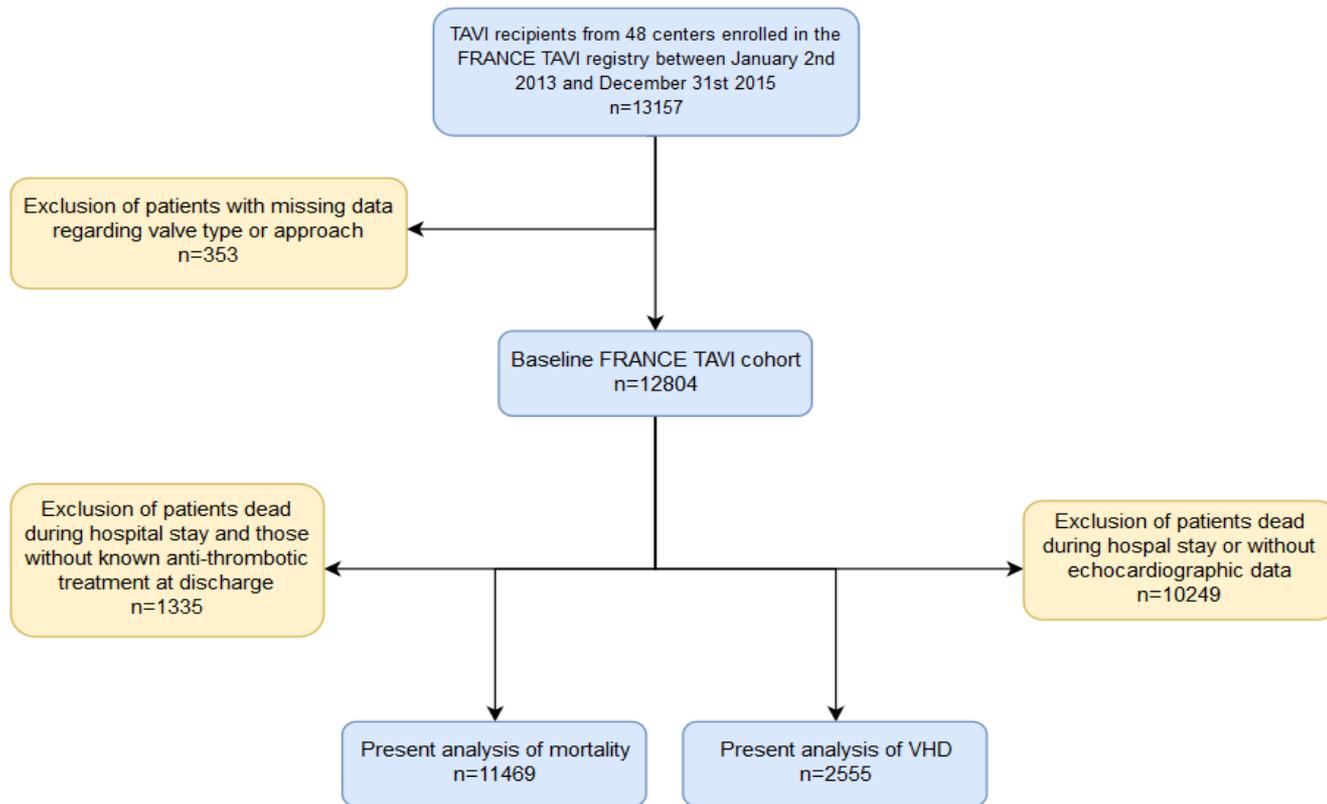

Database: FRANCE TAVI

- **Inclusion** → multi-centre, French, prospective, registry
- **Period** → January 2013 and December 2015
- **Mortality outcome** → INSEE query on April 12th 2016
- **BVD** → Echocardiographic follow-up to May 9th, 2016

Statistical analysis

- **Missing values** → multiple imputation (sensitivity analysis and complete cases)
- **Multivariable Cox regression** for mortality
- **Multivariable logistic regression** for Bioprosthetic Valve Dysfunction
- IBM SPSS Version 23.0 (Armonk, NY: IBM Corp) software

FLOW CHART

PATIENTS CHARACTERISTICS

Characteristics *	Total (n=11469)	No OAC (n=7633)	OAC (n=3836)	P value
Age	82.8 (0.068)	82.7 (0.085)	82.9 (0.111)	0.6

KM CURVES ACCORDING TO ANTICOAGULATION

No

OAC 7632 5282 3393 2123 1154 472 1

OAC 3835 2641 1635 1003 519 223 0

CORRELATES OF BIOPROSTHETIC VALVE DYSFUNCTION

N=2555	m=20	Adj. OR	95% CI	95% CI lower
	P-value		upper	
BMI	0.002	1.05	1.02	1.09
Prior TAVR	0.025	2.96	1.15	7.64
Moderate/severe renal failure	0.034	1.46	1.03	2.08
Non-femoral access	0.049	0.53	0.28	1.02
Prosthesis ≤ 23 mm	<0.001	3.43	2.41	4.89
OAC at discharge	0.005	0.54	0.35	0.82

DISCUSSION

- Post-TAVI ATT → **Driven by patients characteristics**
- OAC → Less BVD → **Potential clinical benefit?**
- OAC use → Colinear with the indication for AF → **Mortality?**

70% patients were on OAC due to AF

LIMITATIONS

- Not randomized → unknown confounders
- Declarative clinical outcome reporting
- Treatment Cross-over → An issue in this elderly population
- Identification of BVD* with MSCT** → Different predictors?

Long-Term Mortality and Early Valve Dysfunction According to Anticoagulation Use: The FRANCE-TAVI registry

Pavel Overtchouk, MD,¹ Paul Guedeney, MD,¹ Stéphanie Rouanet,² Jean Philippe Verhoye, MD,³ Thierry Lefevre, MD,⁴ Eric Van Belle, MD, PhD,⁵ Helene Eltchaninoff, MD, PhD,⁶ Martine Gilard, MD, PhD,⁷ Pascal Leprince, MD, PhD,⁸ Bernard Jung, MD, PhD,⁹ Olivier Barthelemy, MD,¹ Hervé Le Breton, MD,³ Génaud Souteyrand, MD,⁹ Eric Vicaut, MD, PhD,¹⁰ Gilles Montalescot, MD, PhD,¹ Jean-Philippe Collet, MD, PhD¹

ABSTRACT

BACKGROUND The optimal anti-thrombotic treatment after transcatheter aortic valve replacement (TAVR) remains a matter of debate. Dual antiplatelet therapy (DAPT) is recommended but single antiplatelet therapy or oral anticoagulation (OAC) are frequently used according to the patient profile. Whether this may impact clinical outcome is unknown.

METHOD and objectives: FRANCE-TAVI is a prospective multicenter nation-wide French registry. Our objectives were to identify independent correlates of long-term all-cause mortality and early bioprosthetic valve dysfunction (BVD, defined as increased prosthetic gradient ≥ 10 mmHg or new gradient ≥ 20 mmHg).

RESULTS Of 12,804 patients included between January 1, 2013 and December 31, 2015, 11,469 (age 82.8 ± 0.07 years old [mean \pm SE], logistic Euroscore $17.8 \pm 0.1\%$, mean duration follow-up was 495 ± 3.5 days) were alive at discharge with known antithrombotic treatment and were analyzed for mortality. 2555 had at least 2 echocardiographic evaluations and were eligible of BVD assessment. One third of patients had a history of atrial fibrillation and the same proportion had OAC at discharge ($n=3836$). Neither aspirin nor clopidogrel were independently associated with mortality. Male gender (adj HR 1.63 [1.44-1.84], $p < 0.001$), history of atrial fibrillation (adj. HR 1.41 [1.23-1.62], $p < 0.001$) and chronic renal failure (adj. HR 1.37 [1.23-1.53], $p < 0.001$) were the strongest independent correlates of mortality. Anticoagulation at discharge (adj. OR 0.54 [0.35-0.82], $p = 0.005$) and a non-femoral approach (adj. OR 0.53 [0.28-1.02], $p = 0.049$) were independently associated with lower rates of BVD, while chronic renal failure (adj. OR 1.46 [1.03-2.08], $p = 0.034$) and prosthesis size ≤ 23 mm (adj. OR 3.43 [2.41-4.89], $p < 0.001$) yielded higher risk of BVD.

CONCLUSIONS Gender, renal failure and atrial fibrillation, impacted the most mortality at 3-year follow-up. In contrast anticoagulation (mostly given for atrial fibrillation) decreased the risk of BVD after TAVR. (J Am Coll Cardiol 2018;1:1)
